## Executive Summary

Pattle Delamore Partners Limited (PDP) has been engaged by Carter Group Ltd to provide a technical assessment supporting the Fast-track application for operational stormwater discharge consents required for the proposed industrial subdivision at 104 Ryans Rd.

The purpose of this assessment is to outline the infrastructure required for the proposed treatment, attenuation and disposal to ground of stormwater generated within the proposed development. The nature and characteristics of the stormwater discharge are also discussed. This technical document, along with the technical groundwater assessment memo, act as supporting documents to the Assessment of Environmental Effects report prepared by Novo Group Ltd.

Two operational stormwater discharge consents are required to service this development. One consent, a global stormwater consent for the whole site, is required to authorise the various discharges of stormwater generated by runoff from roof and hardstand areas within the individual sites to be created by the subdivision. The second discharge consent is required to authorise the discharge of treated stormwater runoff generated from the road reserve areas created by the subdivision. Both consents are required under Rules 5.96 and 5.97 of the Canterbury Land and Water Regional Plan (LWRP) and the discharges are classified as non-complying activities.

The site (104 Ryans Road) is 55.5 hectares consisting of Pt Lot 3 DP 22679, Lot 4 DP 22679 and Pt Lot 1 DP 2837, with a singular residential dwelling and other farm shed buildings. The site borders the southern boundary of Christchurch International Airport, primarily bound by Ryans Road to the south and Grays Road to the south-east.

The proposed industrial subdivision will involve the development of approximately 126 lots (varying in size), construction of public roading, footpath and berm areas along with two stormwater management areas each containing an infiltration basin and soak pit system. The development is proposed to provide land suitable for the establishment of logistics, warehousing, light manufacturing, and other airport-related businesses capable of providing significant regional/ national economic benefit.

It is proposed that the stormwater within the proposed subdivision will be managed as follows:

- ∴ All run-off from roofed areas on individual lots will be collected by gutters and downpipes and disposed to ground with no treatment by onsite soak pit(s) sized to accommodate a critical duration 2% Annual Exceedance Probability (AEP) event.

- ✧ Remaining stormwater runoff generated on the individual lots from hardstand and pervious areas will be directed to an onsite proprietary treatment device for treatment of the first flush flow prior to disposal to ground via a soak pit. Runoff more than first flush will bypass treatment via primary and secondary conveyance to on-site soak pits for disposal.
- ✧ Run-off generated from the proposed road reserve (road, footpath and berm areas) will be collected in sumps and conveyed via a reticulated network for treatment and attenuation to one of two first flush infiltration basin/ soak pit systems sized to meet the requirements of the Christchurch City Council (CCC) Wetlands, Waterways and Drainage Guide (WWDG).

The proposed infiltration basins will be dry basins which will only retain water for a period during and after a large rainfall event. The proposed system will successfully lower post development runoff to lower than pre-development flows by nature of isolation and disposal of run-off from individual lots. The proposed infiltration basins for both the northern and southern stormwater management areas (SMA) areas have been sized to mitigate potential water surface area by balancing attenuation between the basin and overflow soak pit during the critical 2% AEP design event. Sizing based on current catchment areas indicates both basins would exceed 1000 m<sup>2</sup> and are currently within 0.5km of each other, requiring resource consent under the Christchurch District Plan Airport Birdstrike rules. A global consent is sought for the discharge of stormwater from the proposed development to ground. Operational discharge consent is also sought to authorise the discharge of treated stormwater runoff generated from the road reserve areas created by the subdivision, via the proposed infiltration basins to ground. Consent is also being sought for the construction of both basins.

## 1.0 Introduction

Carter Development Ltd (CGL or “the applicant”) is seeking resource consent for the construction of an industrial subdivision at 104 Ryans Road (“the site”). The subdivision will involve the development of:

- ✧ Approximately 126 lots (of varying size).
- ✧ Construction of public roading, footpath and berm areas.
- ✧ Three waters infrastructure to service proposed lots.

The proposed development is to provide land suitable for the establishment of logistics, warehousing, light manufacturing, and other airport-related businesses capable of providing significant regional/ national economic benefit.

The purpose of this assessment is to outline the infrastructure required for the proposed treatment, attenuation and disposal to ground of stormwater generated within the proposed development. The nature and characteristics of the stormwater discharge are also discussed. This technical document, along with the technical groundwater assessment memo, acts as a supporting document to the Assessment of Environmental Effects report prepared by Novo Group Ltd.

Two operational stormwater discharge consents are required to service this development. One consent, a global stormwater consent for the whole site, is required to authorise the various discharges of stormwater generated by runoff from roof and hardstand areas within the individual sites to be created by the subdivision. The second discharge consent is required to authorise the discharge of treated stormwater runoff generated from the road reserve areas created by the subdivision. Both consents are required under Rules 5.96 and 5.97 of the Canterbury Land and Water Regional Plan (LWRP) and the discharges are classified as non-complying activities.

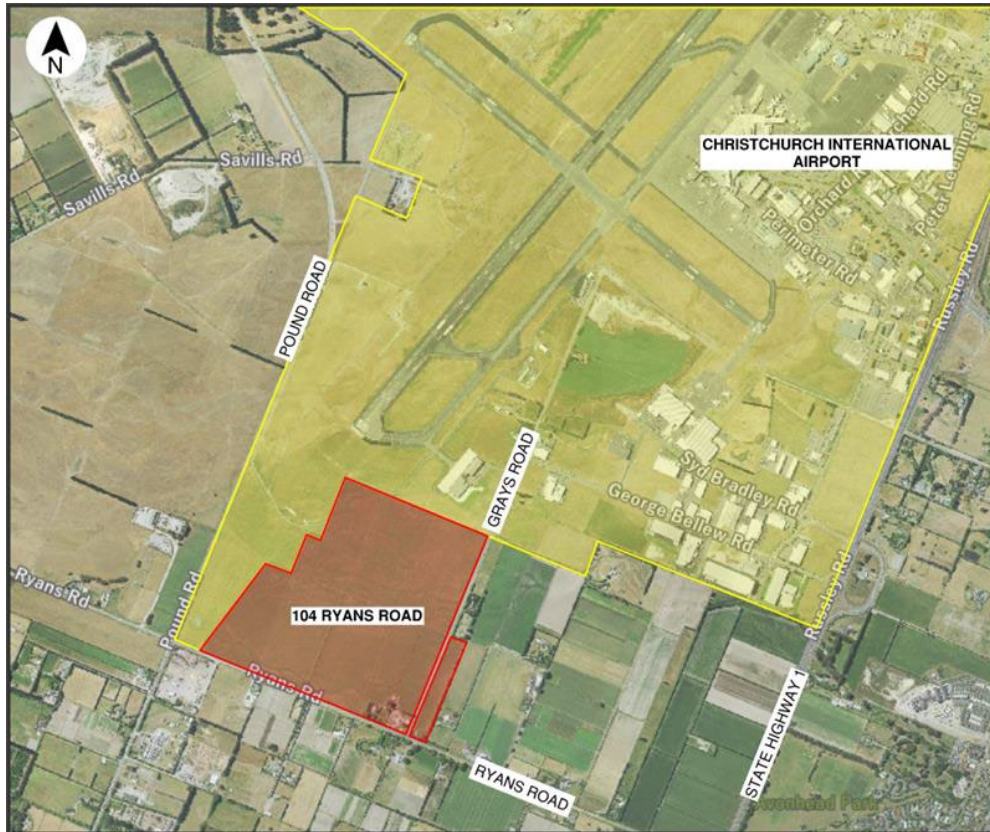

## 2.0 Site and Surrounding Environment

The site of proposed works found at 104 Ryans Road is split across three lots, known legally as:

- ✧ Lot 4 DP 22679
- ✧ Part Lot 3 DP 22679
- ✧ Part Lot 1 DP 2837

The site borders the southern boundary of Christchurch International Airport and is primarily bound by Ryans Road to the south and Grays Road to the south-east. The site is 55.55 hectares in area and is presently zoned as Rural Urban Fringe by the Christchurch City District Plan with a single residential dwelling and

associated infrastructure (shed structures, tanks) located on the south-east corner of the property. The site is currently used for grazing. Figure 1 below shows the site location.

**Figure 1:** 104 Ryans Road site location (aerial courtesy of 'Canterbury Maps')

## 2.1 Topography and Soil

### 2.1.1 Topography and Geotechnical Investigation

The topography of the site is generally flat, sloping from northwest to southeast at an average gradient of 1:200.

A geotechnical assessment of the application site was conducted by Tetra Tech Coffey (9 December 2024) and is attached to the application, which found the following subsurface profile:

- ✧ 0-300 mm Topsoil,
- ✧ 300 – 4000 mm Sand; and
- ✧ 4000 mm – unknown depth, sandy gravel.

Silty lenses were observed within the sand layer, and it is expected that silt content is variable through this layer across the site. A borehole located

immediately next to the northeast corner of the site indicates gravels to extend to at least 15.6 mbgl.

#### 2.1.2 Contamination

Environment Canterbury's (ECan) Listed Land Use Register (LLUR) does not record any registered HAIL activities and the site is therefore not considered to be contaminated.

It is noted that Tetra Coffey completed an environmental investigation given the proposed subdivision development, further information is provided in the Tetra Coffey DSI report which is attached to the application. The soil sampling at the site indicated that the majority of the site returned results which were considered to be below, at or slightly above background concentrations for the contaminants tested. The only exception to this is the small area surrounding the existing farm buildings. These soils surrounding the existing farm buildings will be remediated prior to or at the beginning of subdivision works and managed via a Remedial Action Plan. Furthermore, a Site Validation Report will be completed once remediation works are undertaken. No proposed soakpits will be located within an area of contamination.

### 3.0 Operational Stormwater Management

#### 3.1 Proposed System Overview

The operational stormwater management plan proposes to provide treatment, attenuation and disposal to ground of all site run-off. The proposed stormwater system has been developed to isolate clean and contaminated run-off to efficiently manage, treat and dispose run-off to ground. The methods proposed have been chosen to reduce the size of attenuation/ infiltration basins required for this development given proximity to the airport and corresponding risk of bird strike.

The system will operate as follows:

- ∴ All run-off from roofed areas on each lot will be collected and be disposed to ground with no treatment by onsite soak pit(s) sized to accommodate the critical design event (identified to be the 3hr 2% annual exceedance probability (AEP) event).
- ∴ All other stormwater generated on the individual lots from hardstand areas will be directed to an onsite proprietary treatment device for treatment of the "first flush" flow prior to disposal to ground via a soak pit(s) sized to accommodate the critical design event. The first flush flow is the flow generated by up to a 5mm/hr rainfall intensity on the catchment area.

- ✧ Run-off generated from road, footpath and berm areas will be collected in sumps and conveyed via a reticulated network for treatment in a first flush infiltration basin/ soak pit system sized to accommodate 2% AEP flows.

### 3.2 Treatment and Contaminant Loading/ Removal

Operational phase stormwater runoff from the 104 Ryans Road development site is proposed to be collected and treated via the following process:

- ✧ The runoff from the roof is expected to be clean, so will flow through downpipes and typically be discharged directly to a dedicated “roof” soak pit for soakage to ground, with no treatment provided.
- ✧ The runoff from all other surfaces (hardstand and greenspace) within each lot will be captured by kerbs, channels and sumps and directed to a proprietary treatment device. This device will provide treatment via filtration and adsorption of contaminants. All treated water will then be conveyed to a soak pit for soakage to ground.

Overflow (any volume greater than the first flush volume) from the device will typically be diverted from the first flush proprietary treatment device via an internal bypass to a dedicated “hardstand” soak pit (separate from the “roof” soak pit) and be disposed of via soakage to ground. Combined soakpits can also be used to discharge runoff from both rooves and hardstand.

- ✧ Run-off from contributing hardstand and greenspace areas within the development road reserve, lot driveways, along with Grays/ Ryans Road frontage will be captured by kerb and channel and be directed to one of two stormwater management areas via a reticulated network. It is expected that the contaminant loading of this area will be similar to the hardstand/greenspaces mentioned above. Treatment will be provided by engineered stormwater infiltration basins.

Run-off exceeding first flush and above primary attenuation will divert to an overflow soak pit for disposal to ground.

The basis of this design approach has been developed to remove potentially significant contaminants (e.g. heavy metals and hydrocarbons) expected to be within the operational-phase stormwater runoff. The basis of design aligns with the Christchurch City Council (CCC) Wetlands, Waterways and Drainage Guide (WWDG) and the New Zealand Building Code Clause E1.

#### 3.2.1 Expected Stormwater Contaminants

The contaminants expected to be found in stormwater runoff from site hardstand and trafficked areas are:

- ✧ Hydrocarbons leaked from vehicle engines/transmissions and exhaust fumes.
- ✧ Heavy metals such as zinc (from tyres), copper (from brake linings and tyres), lead (from tyre balance weights), and chromium (from vehicle trim).
- ✧ Sediment from atmospheric deposition and vehicles.

#### 3.2.1.1 Estimated Metal Concentration

Appendix A details an assessment of the typical contaminant concentrations entrained within stormwater runoff from light industrial subdivisions. Using the values presented in Appendix A, the following estimated total metals concentrations have been assumed present in run-off from site hardstand and road surfaces:

- ✧ Total Copper            0.015 mg/L
- ✧ Total Lead             0.037 mg/L
- ✧ Total Zinc             0.67 mg/L
- ✧ Total Chromium    0.0023 mg/L

Copper, lead and zinc are the most typical heavy metal contaminants with respect to stormwater quality. Chromium is also often present in stormwater, however in lower concentrations.

#### 3.2.1.2 Estimated Hydrocarbon Concentration

Analysing the data outlined in Appendix A, the expected hydrocarbon concentrations in routine stormwater discharges from the development at 104 Ryans Road site are therefore:

- ✧ Total petroleum hydrocarbons (TPH): 3.9 mg/L
- ✧ Polycyclic aromatic hydrocarbons (PAH): 0.002 mg/L

#### 3.2.1.3 Estimated Suspended Sediment Concentration

Most of the total suspended solids (TSS) in post-development stormwater runoff from the site would be expected to be derived from sediment carried by vehicles and atmospheric deposition. The expected concentration of sediment in the runoff from the fully developed site is unknown. TSS concentrations in runoff from various industrial sites have been presented in Appendix A.

The values presented suggest that an assumed maximum TSS concentration of 95 mg/L in stormwater runoff could be expected.

### 3.2.2 Removal Efficiency

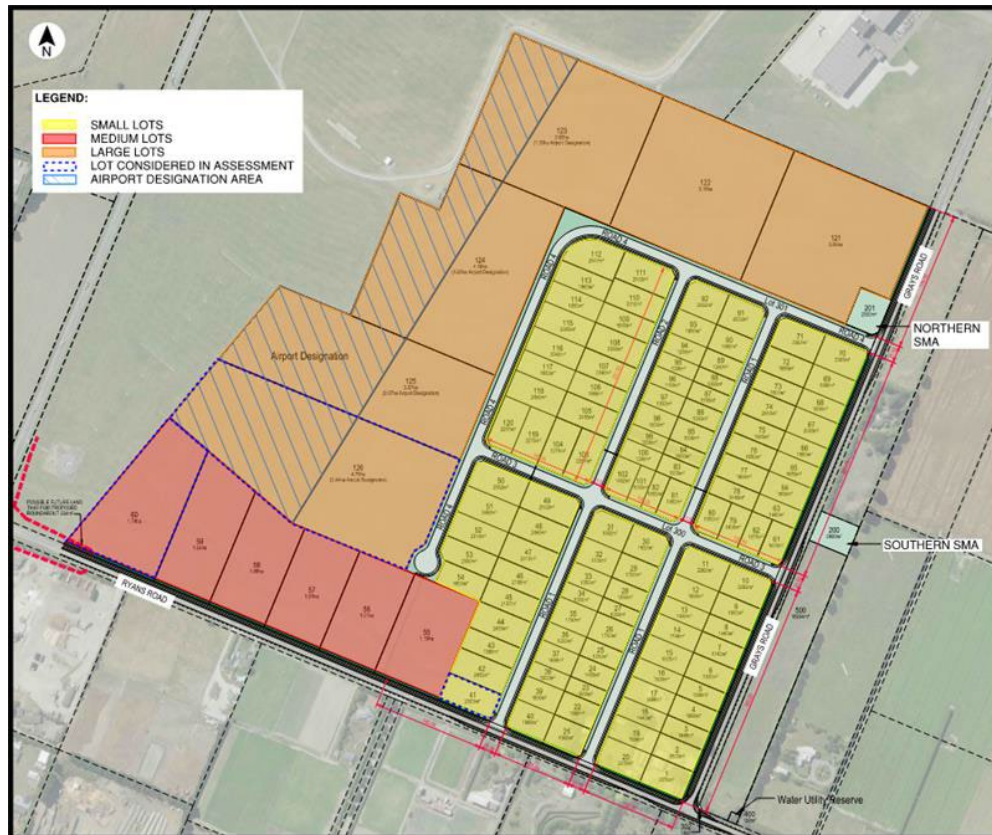

Table 1 presents the estimated removal capability for the proposed first flush detention basin, soakage basin and proprietary stormwater treatment device (e.g., such as a Stormwater360 StormFilter<sup>TM</sup>).

<b>Table 1: Estimated Contaminant Removal Rates for Stormwater Management Devices (% Removal)</b>				
<b>Treatment Device</b>	<b>TSS</b>	<b>Trace Metals</b>	<b>PAHs</b>	<b>TPH</b>
First Flush Detention Basin	40 – 80 <sup>1</sup>	20 - 60 <sup>1</sup>	Data not available	Data not available
Soakage Basin	60 – 100 <sup>1</sup>	40-100 <sup>1</sup>	Data not available	Data not available
Proprietary Treatment Device	80 <sup>2</sup>	60-90 <sup>3</sup>	90-100 <sup>3</sup>	90-100 <sup>3</sup>
<b>Notes:</b> <ol style="list-style-type: none"> <li>1. <i>Waterways, Wetlands and Drainage Guideline, 2012, Christchurch City Council</i></li> <li>2. <a href="#">(Auckland Council Private approval StormFilter Interim Recognition Report Part 1 FINAL.pdf)</a></li> <li>3. <a href="#">(Is there any benefit for Enhanced Stormwater Treatment from Non-forecourt Discharges, H. Easton, PDP)</a></li> <li>4. <a href="#">(Polycyclic aromatic hydrocarbons (PAHs) removal by sorption: A review - ScienceDirect)</a></li> </ol>				

It should be noted that the removal efficiencies of stormwater treatment devices vary significantly due to a number of factors including the nature and contaminant concentrations of the stormwater influent entering a device. Typically, the higher the contaminant concentration entering the device, the more likely it is that the device will achieve the published removal efficiencies. Devices receiving stormwater with low to modest levels of stormwater concentrations will typically achieve lower than published contaminant removal rates.

## 3.3 Individual Lot Stormwater

Noting the site layout provided in Figure 2, the proposed development is formed of different sized lots. To assess operational stormwater treatment and disposal, lots were grouped into three categories (small, medium and large) with sizing undertaken for the largest lot size in each of these categories, refer Figure 2 below. The purpose of the sizing per category is to indicate that sizing of appropriate soakage systems can be achieved for lots in each of the lot categories. Individual soakpit sizing and design for each lot will be undertaken at the time of building consent.

**Figure 2:** Lot designation for purpose of operational stormwater assessment (background layout plan courtesy of 'Capture Land Development Consultants')

As illustrated in Figure 2, the following maximum lot sizes were found and have been used to size the required operational stormwater infrastructure.

Small Lot: 2,600 m<sup>2</sup>

Medium Lot: 17,400 m<sup>2</sup>

Large Lot: 47,600 m<sup>2</sup>

This method was undertaken as it ensures required treatment and/or disposal sizing is sufficient to manage run-off from all proposed lots within the development. It is noted that four of the large lots are affected by the Airport Designation (refer Figure 2), within this zone there are restrictions on vertical development. Therefore, the largest lot site, used for calculation "large" category below, has assumed slightly different development configurations for the ratio of building area to hardstand and greenspace areas.

### 3.3.1 Roof Water Disposal

The required infiltration area for roof water disposal to ground has been sized for the three typical lot sizes outlined in Section 3.3 assuming the following parameters and assumptions:

- ✧ An in-situ infiltration rate of 600mm/hr (refer Tetra Coffey Geotechnical Investigation). It is noted from the geotechnical report that there was a range of infiltration rates recorded at the site, up to 6000 mm/hr in one test and 125mm/hr in another. It is clear from the test pits results that gravel depth varies across the site and some of the slower infiltration tests were potentially not conducted sufficiently deep into the gravel layers. An infiltration rate of 600 mm/hr is considered a conservative design infiltration rate for the site. However, each soakpit location will require individual testing to confirm final sizing at Building Consent stage. If higher design rates are encountered, then the appropriate soakage areas may be smaller than indicated below.
- ✧ Soakpits will be constructed to a minimum of 1 m depth into free draining gravels.
- ✧ A void ratio of 0.38 which represents a clean rock filled soak-pit.
- ✧ No treatment of run-off prior to disposal as roof water is considered clean.
- ✧ Roof area assumed to have 50% coverage of lot sizes for small and medium lot categories. For the large lot category, a roof area coverage of 41% has been assumed.
- ✧ A weighted site run-off coefficient assuming 40% hardstand ( $C = 0.85$ ), 10% green space ( $C = 0.25$ ) area (excluding roof area contributions).
- ✧ The roof water soak pit is sized for a 2% AEP rainfall event following CCC design standards.
- ✧ Rainfall data for this event was taken from HIRDS Version 4, for the RCP8.5 scenario, for 2081-2100 for a 180 min duration with an interpolated average rainfall intensity of 22.8 mm/hr.

Using the above parameters, Table 2 identifies the minimum total infiltration area per lot and soak pit operational depth required for the lot sizes identified:

Table 2: Roof Water Soak Pit Sizing		
Lot Category	Base Area (m <sup>2</sup> )	Soak Pit Operational Depth (m)
Small	30	3
Medium	204	3
Large	462	3

It is important to note that this sizing is the total minimum required base area for assumed operational depth. For the medium and large lot categories, it is expected numerous soak pits will be developed and positioned strategically throughout each developed lot. Stormwater plans and calculations are included in Appendix B.

### 3.3.2 Individual Lot Hardstand Treatment and Disposal

It is proposed that all run-off from non-roofed areas within individual lots will be treated and disposed on each particular site. The use of proprietary treatment has been considered for this development to maximise available hardstand and undertake all stormwater management/ disposal below ground.

Characteristics of the proposed stormwater system are outlined by the following:

- ✧ Primary flows to be captured by kerbs, channels and sumps and conveyed to a proprietary treatment device.
- ✧ Treatment of the first flush flow is to be undertaken within the proprietary device (i.e., a Stormwater360 StormFilter™ or equivalent). Flows in excess of the first flush flow will by-pass the treatment device via an internal bypass in the treatment device and, along with the treated stormwater flow, discharge will be disposed to ground via an on-site soak pit(s).
- ✧ Secondary flows, in excess of the stormwater pipe capacity will be directed via kerbs, channels and overland flow towards a scruffy dome entry to the soakpit and disposed to ground via on-site soakage.

Considering the typical lot areas identified in Section 3.3, required infrastructure for onsite treatment and disposal has been designed assuming the following parameters.

- ✧ First flush flow is derived from a rainfall intensity of 5mm/hr.
- ✧ A weighted site run-off coefficient assuming 40% hardstand (C = 0.85), 10% green space (C = 0.25) area (excluding roof area contributions) for small and medium category lots. For large lots, a weighted site run-off coefficient assuming 53% hardstand (C = 0.85), and 5% green space (C = 0.25) area (excluding roof area contributions) has been used.

- ✧ Primary conveyance system (i.e. pipe network) sized to accommodate flows corresponding to a 60 min 10% AEP RCP8.5 rainfall event.
- ✧ Secondary flow network (i.e. overland flow paths) and soak pit for disposal to ground sized to accommodate the critical duration 2% AEP rainfall event.
- ✧ Stormwater360 StormFilter™ proprietary treatment device has been selected for the purpose of this investigation (Cartridge height: 69cm, Media: Perlite). A number of other media filtration devices on the market also provide a comparable level of treatment.
- ✧ A soakage rate of 600mm/hr (refer Tetra Coffey Geotechnical Report).
- ✧ Soakpits will be constructed to a minimum of 1 m depth into free draining gravels at a depth of approximately 5 to 6m.

Using the above parameters, Table 3 shows minimum proprietary treatment and soakage dimensions required per lot to manage first flush treatment and run-off up to the 2% AEP rainfall event. Stormwater plans and calculations are included in Appendix B.

Table 3: Proprietary treatment and soak pit sizing for lots				
	First Flush Run-off and WQ Treatment Flows		Minimum Soak Pit Area Per Lot (2% AEP RCP8.5)	
Lot Category	FF Flow (L/s)	StormFilter™ Max Treatment Flow (L/s)	Infiltration Area (m²)	Soak Pit Operational Depth (m)
Small	1.30	1.42	23	3
Medium	8.82	9.94	152	3
Large	30.93	31.24	580	3

Assuming a Stormwater360 StormFilter™ device is used, the number of filtration cartridges needed to service the water quality flow (WQ) for each lot size is as follows.

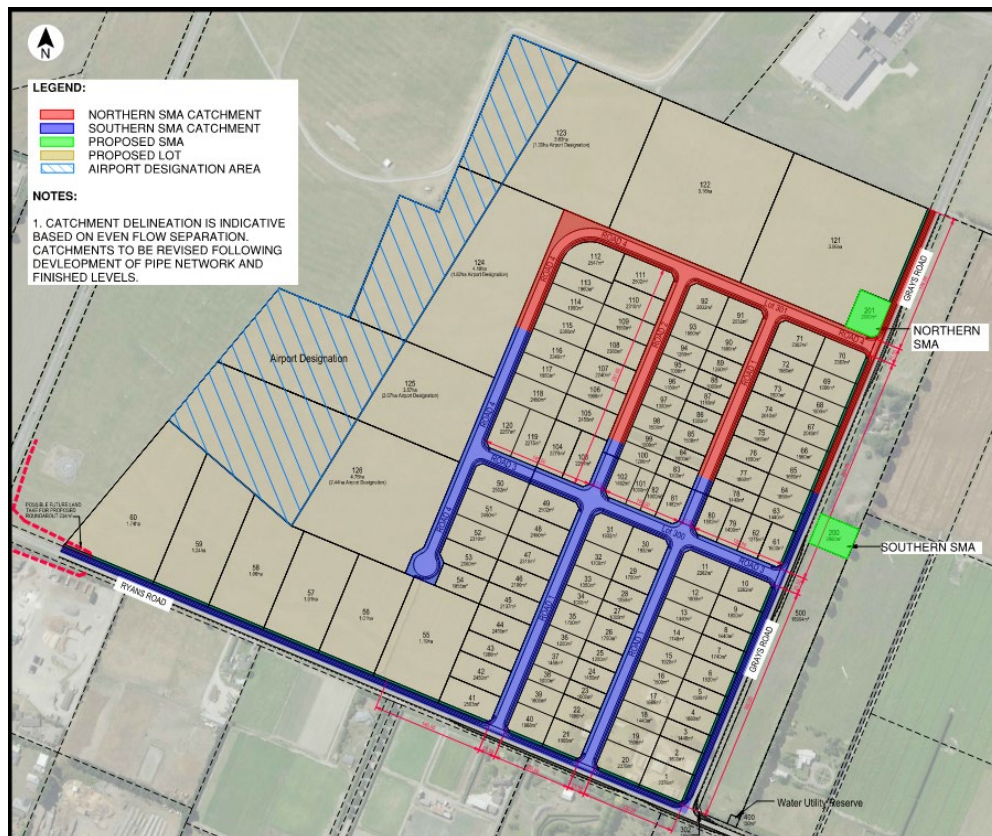

- ✧ Small lot: 1 cartridge to provide treatment for WQ of 1.30 L/s.
- ✧ Medium lot: 7 cartridges to provide treatment for WQ flow of 8.82 L/s.
- ✧ Large lot: 22 cartridges to provide treatment for WQ flow of 30.93 L/s.

For medium and larger category lot sizes, it is assumed that the required number of filtration cartridges may be split across multiple manhole chambers rather than utilising a single large chamber to house a large number of filtration

cartridges. Furthermore, it is expected numerous appropriately sized soak pits totalling the requirements of Table 3 will be developed and positioned strategically throughout each developed lot.

### 3.4 Road Reserve Stormwater

The proposed stormwater servicing plan is attached in Appendix B of this Report. Stormwater is to be collected from the road reserve via a network of kerb and channel, sumps and pipework which discharge to two stormwater management areas (SMA's). Figure 3 below shows the proposed catchment areas for each SMA. The two SMA sites are proposed to treat first flush run-off, attenuate and dispose run-off for the catchment areas during the critical design event. Each SMA will include an infiltration basin and overflow soak pit. Indicative locations of the two stormwater management areas are shown in Figure 3 below.

**Figure 3:** Proposed catchment delineation (background layout and catchment delineation courtesy of 'Capture Land Development Consultants')

Assuming the catchments in Figure 3, sizing of proposed infiltration basins and overflow soak pits have been governed by the following parameters.

- ✧ Total contributing catchment area
  - Northern SMA Catchment: 28,000 m<sup>2</sup> (red hatch)
  - Southern SMA Catchment: 45,500 m<sup>2</sup> (blue hatch)
- ✧ First flush rainfall depth of 25 mm
- ✧ First flush basin infiltration rate of 75mm/hr CCC WWDG.
- ✧ The overflow soak pit and associated detention volume is sized for a 2% AEP rainfall event following CCC design standards.
- ✧ Overall basin volumes are sized for minimum storage volume determined from catchment run-off corresponding to 10% AEP, 18-hour storm.
- ✧ A soak pit soakage rate of 600mm/hr (refer Tetra Tech Coffey Geotechnical Assessment Report).
- ✧ A void ratio of 0.38 which represents a clean rock filled soak-pit.

Refer to Table 4 for indicative infiltration basin and soak pit sizing for both Northern and Southern SMA areas.

Table 4: Infiltration basin and soak pit sizing for critical storm						
Infiltration Basin					Overflow Soak Pit	
SMA	Top Length (m)	Top Width (m)	Top Area (m <sup>2</sup> )	Maximum Water Surface Area (m <sup>2</sup> )	Infiltration Area (m <sup>2</sup> )	Soak pit Operational Depth (m)
Northern	37	37	1369	1200	125	3
Southern	44	43	1892	1690	190	3

Proposed infiltration basins for both northern and southern SMA areas have been sized in accordance with the requirements of the WWDG. They will mitigate potential water surface area by balancing attenuation storage between the basin and overflow soak pit during the critical 2 % AEP event whilst ensuring that the minimum basin volume provided is at least the equivalent runoff volume from the 10% AEP 18-hour event assuming climate change scenario RCP8.5. Noting the site is located adjacent to Christchurch International Airport, the CCC District Plan Rule 6.7.4.3 P3 for the creation of new stormwater basins in the Bird strike Management Area specifies that;

*"The combined area of all stormwater basins and/or water bodies, that are wholly or partly within 0.5km of the proposed water body or stormwater basin's edge, shall not exceed 1,000m<sup>2</sup>."*

As shown in Table 4, both basins would exceed the maximum 1000 m<sup>2</sup> and are currently within 0.5km of each other. Therefore, resource consent is required for construction and operation of both basins as currently sized.

#### 4.0 Summary

Stormwater from the proposed industrial development at 104 Ryans Road will need to be managed to ensure adverse effects of the development on flooding are less than minor and that the stormwater discharge quality meet discharge limits. The stormwater management for the site has been designed so that the post-development flows for the site are equivalent to or lower than the pre-development flows up to the 50 -year ARI flood event, including climate change considerations of Scenario RCP 8.5 for 2081-2100.

It is proposed that stormwater runoff within each proposed lot will be managed/ treated and disposed independently on each lot. Run off from roofed areas will be collected by gutters/ downpipes and disposed to ground by onsite soak pit(s). While all other stormwater generated from hardstand and pervious areas will be treated by a proprietary treatment device prior to disposal to ground via onsite soak pit(s) for the critical design event. Required treatment of the first flush volume from contributing lot hardstand has been calculated assuming typical lot sizes and assuming treatment specifications of a Stormwater360 StormFilter™. It is noted equivalent/ alternative proprietary treatment systems are available.

For stormwater within the proposed road reserve area, run-off is to be collected by sumps and conveyed via a reticulated network for treatment/ disposal in a first flush infiltration basin/soak pit system. The development has been divided into two stormwater catchment areas to manage road reserve runoff. As such, two SMA areas containing a first flush infiltration basin/ soak pit systems have been proposed, one servicing the northern catchment and one servicing the southern catchment area. Sizing investigations revealed both infiltration basins would exceed the maximum 1000 m<sup>2</sup> combined water surface area requirements of the Christchurch District Plan. As such, consent is sought for construction and operation of both basins as currently sized and located. A global stormwater discharge consent is also sought as part of this application.

## **Appendix A: Typical Contaminant Concentrations in Stormwater from Hardstand Surfaces**

Typical concentrations of suspended solids and heavy metals for stormwater derived from light industrial land uses have been determined using the Urban Runoff Quality Information System (URQIS), developed by NIWA. URQIS is a resource developed in 2012 that provides stormwater and urban stream quality data to the public by accessing a database of urban runoff quality data collected from all over New Zealand, compiled by NIWA. The database includes data supplied by Councils, Transport Agencies, Research Institutes and Universities across New Zealand

### Expected Total Suspended Solids Concentrations

Table 1: Typical Metals Concentrations in Stormwater from Light Industrial Land uses	
Contaminant	URQIS Light Industrial Land use (median from 1298 samples) <sup>1</sup>
TSS (mg/L)	20
Notes: 1. NIWA Urban Quality Information System. <a href="https://niwa.co.nz/freshwater/urban-runoff-quality-information-system-urqis">https://niwa.co.nz/freshwater/urban-runoff-quality-information-system-urqis</a>	

### Expected Metal Contaminant Concentrations

Table 2: Typical Metals Concentrations in Stormwater from Light Industrial Land uses	
Contaminant	URQIS Light Industrial Land use Median Concentration (no. of samples) <sup>1</sup>
Copper, dissolved (mg/L)	0.0058 (653 samples)
Copper, total (mg/L)	0.015 (536)
Lead, dissolved (mg/L)	0.00049 (19)
Lead, total (mg/L)	0.0037 (127)
Zinc, dissolved (mg/L)	0.42 (421)
Zinc, total (mg/L)	0.67 (528)
Chromium, total (mg/L)	0.0023 (13)
Notes: 1. NIWA Urban Quality Information System. <a href="https://niwa.co.nz/freshwater/urban-runoff-quality-information-system-urqis">https://niwa.co.nz/freshwater/urban-runoff-quality-information-system-urqis</a>	

### Expected Total Petroleum Hydrocarbon Concentrations

The concentrations of total petroleum hydrocarbon (TPH) in stormwater from two different studies are shown in Table 3. A road runoff sampling programme (Moores et al., 2009) took 29 samples across four sites on state highways in and around Auckland, between 2007-2009. Only eight samples had TPH detected (above the detection limit of 0.7 mg/L). Seven of these were collected at the Westgate site, with TPH values ranging from 0.84 to 3.9 mg/L, and the remaining sample was recorded at Huapai with a TPH concentration of 0.77 mg/L. Westgate had a higher traffic volume per day than Huapai and was the most congested of the four sites. Based on this, and the fact that TPHs from the 104 Ryans Road development site will be coming from heavy vehicles, a conservative TPH value of 3.9 mg/L is assumed.

Table 3: Total Petroleum Hydrocarbon Concentrations in Stormwater		
Contaminant	Residential Subdivisions (Christchurch, 2005) <sup>1</sup>	State Highway 16 at Huapai (Auckland, 2008) <sup>2</sup>
TPH (mg/L)	< 0.2	3.9
Notes: 1. (Pasco, 2005) 2. (Moores et al., 2009)		

### Polycyclic Aromatic Hydrocarbons

A study conducted by Kingett Mitchell in 2005 assessed polycyclic aromatic hydrocarbons (PAH) in a variety of locations across Wellington. The highest concentration of PAH identified was 0.002 mg/L from an industrial site. Minimal PAH data exists for Christchurch, but Adams et al. (2007) reported that stormwater from a carpark showed no detectable PAHs. Although PAHs are generally not detected in stormwater samples, a conservative value of 0.002 mg/L will be assumed as this was the highest measured concentration found from an industrial site, which is representative of the 104 Ryans Road site.

Stormwater Infrastructure Design

Client Name:	Carter Group Limited
Job Name:	104 Ryans Road
Scenario / Description:	Southern SMA: Infiltration Basin and Soak Pit Sizing
Date:	21/01/2025

Job Number:	C052850001
Prepared By:	Cameron Swales and Oliver Saunders
Checked By:	Eoghan O'Neill
Version No.	1

Step 1: Characterise Site		
Hardstand & Greenspace Areas - Route to FF Basin		
Site Area	45430	m <sup>2</sup>
Composite First Flush Coefficient	0.67	#

First Flush Basin Size		
First Flush Design Event		
Rainfall Depth	25	mm
First Flush Runoff Volume (WQV)	761.0	m <sup>3</sup>

FF Basin Dimensions		
Top Length	44	m
Top Width	43	m

Total Depth	3	m
Freeboard Depth	0.3	m
Depth to Overflow	2.7	m
Side Slopes	4	H : V

Total Volume	3120.0	m <sup>3</sup>
Basin Volume (total less freeboard)	2583.1	m <sup>3</sup>
Available Volume	1822.2	m <sup>3</sup>

FF Basin Infiltration		
Infiltration Rate	75	mm/hr
Base Infiltration	0.475	m <sup>3</sup> /min
Base Area	380	m <sup>2</sup>
Drain Time (full use of available WQV)	90.6	hrs

Basin Overflow Soakpit Size		
Basin Soakpit Dimensions		
Depth	3	m
Base Area	190	m <sup>2</sup>
Void Ratio	0.38	#
Soakpit Volume	216.6	m <sup>3</sup>

Basin Soakpit Infiltration		
Infiltration Rate	600	mm/hr
Discharge Rate	1.360	m <sup>3</sup> /min

Basin Soakpit Design Event											
Scenario	Rainfall Intensities (mm/hr) :: RCP8.5 for the period 2081-2100										
ARI	50										
	10m	20m	30m	1h	2h	6h	12h	24h	48h	72h	Critical Event
						CRITICAL					
Storm Duration (min):	10	20	30	60	120	360	720	1440	2880	4320	360
Average Intensity (mm/hr):	98.80	66.90	53.70	37.30	25.80	13.80	9.06	5.73	3.51	2.58	13.80
[Output] Peak Basin Volume (m <sup>3</sup> ):	492.39	660.15	760.95	760.95	942.05	1297.77	1242.81	760.95	760.95	760.95	1297.77
[Output] Misc. Checks Error Log:	None	None	None	None	None	None	None	None	None	None	No Errors Found
				1 day		2 days			3 days		

Summary:		
Critical Storm Summary		
TOTAL RAINFALL VOLUME	2520.27	m <sup>3</sup>
Excess volume peak	1041.18	m <sup>3</sup>
WQV - spare	781.01	m <sup>3</sup>
FF Basin Drain Down Time	63.23	hrs

Inputs Summary

Storm Duration:	360	min
Average Intensity:	13.80	mm/hr
Peak Volume:	1802.13	m <sup>3</sup>
Desired Accuracy:	2	# of dp's
